Lecture 5. Basic and Advanced SQL (Chapter 6 and 7)

alisa.lincke@lnu.se

Outline

- SQL Data Definition and Data Types
- Specifying Constraints in SQL
- Basic Retrieval Queries in SQL
- INSERT, DELETE, and UPDATE Statements in SQL
- Break 10 min
- More Complex SQL Retrieval Queries:
 - JOIN, Aggregation, GROUP BY, nested queries

About SQL

- SQL (Structured Query Language, come from the word "SEQUEL" (Structured English Query Language)) is a standard language for storing, manipulating, and retrieving data in database.
- SQL was developed in the 1970s by IBM Computer Scientists
- Considered one of the major reasons for the commercial success of relational databases
- SQL uses the terms *table*, *row*, and *column* for the formal relational terms *relation*, *tuple*, and *attribute* respectively.
- SQL allows a table to have two or more tuples that are identical in all their attribute values
- Every statement in SQL finished by semicolon ";"
- SQL Syntax: https://www.tutorialspoint.com/sql/sql-syntax.htm

SQL Schema

- SQL Schema is a database description which :
 - Identified by a schema name
 - Includes an authorization identifier to indicate the user or account who owns schema
 - Includes description of each elements of the schema (tables, types, constrains, views, domains, etc.)
- A Schema is created via the CREATE SCHEMA statement which can include all the schema elements definitions.

Defining COMPANY Schema (1)

Some foreign keys may cause errors Specified either via:

Circular references

Or because they refer to a table that has not yet been created

```
CREATE TABLE EMPLOYEE
       (Fname
                                   VARCHAR(15)
                                                                NOT NULL,
        Minit
                                   CHAR,
        Lname
                                   VARCHAR(15)
                                                                NOT NULL.
        Ssn
                                   CHAR(9)
                                                                NOT NULL,
        Bdate
                                   DATE,
        Address
                                   VARCHAR(30),
        Sex
                                   CHAR,
        Salary
                                   DECIMAL(10,2),
                                   CHAR(9),
        Super ssn
        Dno
                                   INT
                                                                NOT NULL,
       PRIMARY KEY (Ssn),
CREATE TABLE DEPARTMENT
       (Dname
                                   VARCHAR(15)
                                                                NOT NULL,
        Dnumber
                                   INT
                                                                NOT NULL.
        Mgr ssn
                                   CHAR(9)
                                                                NOT NULL,
        Mgr_start_date
                                   DATE,
       PRIMARY KEY (Dnumber),
       UNIQUE (Dname),
       FOREIGN KEY (Mgr ssn) REFERENCES EMPLOYEE(Ssn) );
CREATE TABLE DEPT LOCATIONS
       ( Dnumber
                                   INT
                                                                NOT NULL.
        Dlocation
                                   VARCHAR(15)
                                                                NOT NULL,
       PRIMARY KEY (Dnumber, Dlocation),
       FOREIGN KEY (Dnumber) REFERENCES DEPARTMENT(Dnumber) );
```

Defining COMPANY Schema (1)

```
CREATE TABLE PROJECT
       (Pname
                                   VARCHAR(15)
                                                               NOT NULL.
        Pnumber
                                   INT
                                                               NOT NULL.
                                   VARCHAR(15),
        Plocation
        Dnum
                                   INT
                                                               NOT NULL.
       PRIMARY KEY (Pnumber),
       UNIQUE (Pname),
       FOREIGN KEY (Dnum) REFERENCES DEPARTMENT(Dnumber) ):
CREATE TABLE WORKS ON
        Essn
                                   CHAR(9)
                                                               NOT NULL,
        Pno
                                   INT
                                                               NOT NULL,
        Hours
                                   DECIMAL(3,1)
                                                               NOT NULL,
       PRIMARY KEY (Essn, Pno),
       FOREIGN KEY (Essn) REFERENCES EMPLOYEE(Ssn),
       FOREIGN KEY (Pno) REFERENCES PROJECT(Pnumber) ):
CREATE TABLE DEPENDENT
        Essn
                                   CHAR(9)
                                                               NOT NULL.
        Dependent_name
                                   VARCHAR(15)
                                                               NOT NULL,
        Sex
                                   CHAR,
        Bdate
                                   DATE,
                                   VARCHAR(8).
        Relationship
       PRIMARY KEY (Essn, Dependent name),
       FOREIGN KEY (Essn) REFERENCES EMPLOYEE(Ssn) );
```

Attribute Data Types in SQL

Basic data types

- **Numeric** data types
 - Integer numbers: INTEGER, INT, and SMALLINT
 - Floating-point (real) numbers: FLOAT or REAL, and DOUBLE PRECISION
- Character-string data types
 - Fixed length: CHAR (n)
 - Varying length: VARCHAR (n)
- **Bit-string** data types
 - Fixed length: BIT (n)
 - Varying length: BIT VARYING (n)
- Boolean data type
 - Values of TRUE or FALSE or NULL
- **DATE** data type
 - Ten positions
 - Components are YEAR, MONTH, and DAY in the form YYYY-MM-DD
 - Multiple mapping functions available in RDBMSs to change date formats

Additional Data Types in SQL

• Timestamp data type

Includes the DATE and TIME fields

- Plus a minimum of six positions for decimal fractions of seconds
- Optional WITH TIME ZONE qualifier
- INTERVAL data type
 - Specifies a relative value that can be used to increment or decrement an absolute value of a date, time, or timestamp
- **DATE, TIME, Timestamp, INTERVAL** data types can be **cast** or converted to string formats for comparison
- Different DBMS have added more data types to SQL which are not presented in this lecture.

Domains in SQL

Domain

- Name used with the attribute specification
- Makes it easier to change the data type for a domain that is used by numerous attributes
- Improves schema readability
- Example:
 - CREATE DOMAIN SSN TYPE AS CHAR(9);

Specifying Constraints in SQL

- Key constraint: A primary key value cannot be duplicated
- Entity Integrity Constraint: A primary key value cannot be NULL
- Referential integrity constraints: The "foreign key " must have a value that is already present as a primary key, or may be NULL.
- Restrictions on attribute domains:
 - Default value of an attribute
 - DEFAULT <value>
 - NULL is not permitted for a particular attribute (NOT NULL)
 - CHECK clause
 - Dnumber INT NOT NULL CHECK (Dnumber > 0 AND Dnumber < 21);

Specifying Key and Referential Integrity Constraints

PRIMARY KEY clause

Specifies one or more attributes that make up the primary key of a relation

Example: Dnumber INT PRIMARY KEY;

UNIQUE clause

Specifies alternate (secondary) keys (called CANDIDATE keys in the relational model).

Example: Dname VARCHAR(15) UNIQUE;

FOREIGN KEY clause

Default operation: reject update on violation

Attach referential triggered action clause:

Options include SET NULL, CASCADE, and SET DEFAULT

Action taken by the DBMS for SET NULL or SET DEFAULT is the same for both ON DELETE and ON UPDATE

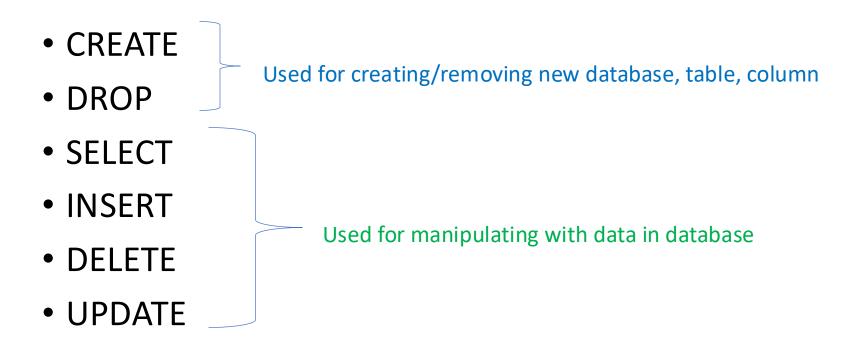

CASCADE option suitable for "relationship" relations

Example

Constraints can be specified when a table is created with the CREATE TABLE statement or you can use the ALTER TABLE statement to create constraints even after the table is created.

```
CREATE TABLE EMPLOYEE
     Dno
               INT
                          NOT NULL
                                       DEFAULT 1,
   CONSTRAINT EMPPK
    PRIMARY KEY (Ssn),
   CONSTRAINT EMPSUPERFK
    FOREIGN KEY (Super_ssn) REFERENCES EMPLOYEE(Ssn)
                 ON DELETE SET NULL
                                          ON UPDATE CASCADE.
   CONSTRAINT EMPDEPTFK
    FOREIGN KEY(Dno) REFERENCES DEPARTMENT(Dnumber)
                 ON DELETE SET DEFAULT
                                          ON UPDATE CASCADE);
CREATE TABLE DEPARTMENT
   ( ...,
    Mgr_ssn CHAR(9)
                          NOT NULL
                                        DEFAULT '888665555'.
   CONSTRAINT DEPTPK
    PRIMARY KEY (Dnumber),
   CONSTRAINT DEPTSK
    UNIQUE (Dname),
   CONSTRAINT DEPTMGRFK
    FOREIGN KEY (Mgr_ssn) REFERENCES EMPLOYEE(Ssn)
                 ON DELETE SET DEFAULT
                                          ON UPDATE CASCADE):
CREATE TABLE DEPT LOCATIONS
   PRIMARY KEY (Dnumber, Dlocation),
   FOREIGN KEY (Dnumber) REFERENCES DEPARTMENT(Dnumber)
               ON DELETE CASCADE
                                          ON UPDATE CASCADE);
```

Basic Commands in SQL

SELECT Command

- This command helps in retrieving a single or multiple rows from one or multiple tables of the database. We can also use this command with the WHERE clause.
- Basic form of the SELECT statement:

```
SELECT <attribute list>
FROM 
WHERE <condition>;
```

where

- <attribute list> is a list of attribute names whose values are to be retrieved by the query.
- is a list of the relation names required to process the query.
- <condition> is a conditional (Boolean) expression that identifies the tuples to be retrieved by the query.

Selecting Records from a Single Table

Retrieving all rows and columns from a table

```
SELECT *
FROM company.employee;
```

Retrieving a subset of rows from a table

```
SELECT fname, Iname FROM company. employee;
```

Retrieving a subset of rows with a condition

```
SELECT Bdate, Address
FROM EMPLOYEE
WHERE Fname='John' AND Minit="B" AND Lname="Smith";
```

Selecting Records from a Single Table

Sorting Query Results

```
SELECT Fname,Lname

FROM EMPLOYEE

WHERE Dno= 5

ORDER BY Salary ASC;
```

Searching for a particular substring or pattern.
 SELECT *
 FROM EMPLOYEE

WHERE Address LIKE '%Houston%';

Retrieving distinct salary

SELECT DISTINCT Salary **FROM** employee **ORDER BY** Salary **ASC**;

WHERE clause

- Selection condition:
 - **OR, AND**: Boolean condition that must be true for any retrieved tuple. Selection conditions include join conditions when multiple relations are involved.
- Logical comparison operators

$$=$$
, <, <=, >, >=, and <>

- Projection attributes
 - Attributes whose values are to be retrieved
- LIKE comparison operator
 - Used for string pattern matching
 - % replaces an arbitrary number of zero or more characters
 - underscore (_) replaces a single character

```
Examples: WHERE Address LIKE '%Houston,TX%'; WHERE Ssn LIKE '_ 1_ 8901';
```

• **BETWEEN** comparison operator

Example: WHERE (Salary BETWEEN 30000 AND 40000) AND Dno = 5;

Selecting data from multiple tables(1)

<u>Bdate</u>	<u>Address</u>		
1965-01-09	731 Fondren, Houston, TX		

<u>Fname</u>	<u>Lname</u>	<u>Address</u>		
John	Smith	731 Fondren, Houston, TX		
Franklin Wong		638 Voss, Houston, TX		
Ramesh Narayan		975 Fire Oak, Humble, TX		
Joyce English		5631 Rice, Houston, TX		

Query 1. Retrieve the name and address of all employees who work for the 'Research' department.

Q1: SELECT Fname, Lname, Address

FROM EMPLOYEE, DEPARTMENT

WHERE Dname='Research' AND Dnumber=Dno;

Retrieving data from multiple tables (2)

(c)	<u>Pnumber</u>	Dnum	Lname	Address	<u>Bdate</u>
	10	4	Wallace	291Berry, Bellaire, TX	1941-06-20
	30	4	Wallace	291Berry, Bellaire, TX	1941-06-20

Query 2. For every project located in 'Stafford', list the project number, the controlling department number, and the department manager's last name, address, and birth date.

O2: SELECT Pnumber, Dnum, Lname, Address, Bdate
FROM PROJECT, DEPARTMENT, EMPLOYEE
WHERE Dnum=Dnumber AND Mgr_ssn=Ssn AND
Plocation='Stafford';

Ambiguous Attribute Names

- Same name can be used for two (or more) attributes in different relations
 - As long as the attributes are in different relations
 - Must qualify the attribute name with the relation name to prevent ambiguity

Q1A: SELECT Fname, EMPLOYEE.Name, Address

FROM EMPLOYEE, DEPARTMENT

WHERE DEPARTMENT.Name='Research' AND

DEPARTMENT.Dnumber=EMPLOYEE.Dnumber;

Aliasing, and Renaming

Aliases or tuple variables

 Declare alternative relation names E and S to refer to the EMPLOYEE relation twice in a query:

Query Example. For each employee, retrieve the employee's first and last name and the first and last name of his or her immediate supervisor.

SELECT E.Fname, E.Lname, S.Fname, S.Lname

FROM EMPLOYEE **AS** E, EMPLOYEE **AS** S

WHERE E.Super_ssn=S.Ssn;

 Recommended practice to abbreviate names and to prefix same or similar attribute from multiple tables.

Unspecified WHERE Clause and Use of the Asterisk

- Specify an asterisk (*)
 - Retrieve all the attribute values of the selected tuples
 - The * can be prefixed by the relation name; e.g., EMPLOYEE *

```
Q1C: SELECT *
FROM EMPLOYEE
WHERE Dno=5;

Q1D: SELECT *
FROM EMPLOYEE, DEPARTMENT
WHERE Dname='Research' AND Dno=Dnumber;

Q10A: SELECT *
FROM EMPLOYEE, DEPARTMENT;
```

DISTINCT clause

- SQL does not automatically eliminate duplicate tuples in query results
- For aggregate operations (See sec 7.1.7) duplicates must be accounted for
- Use the keyword DISTINCT in the SELECT clause
 - Only distinct tuples should remain in the result

Query 11. Retrieve the salary of every employee (Q11) and all distinct salary values (Q11A).

Q11: SELECT ALL Salary

FROM EMPLOYEE;

Q11A: SELECT DISTINCT Salary

FROM EMPLOYEE;

Arithmetic Operations in SELECT

Standard arithmetic operators:

 Addition (+), subtraction (-), multiplication (*), and division (/) may be included as a part of SELECT

Query Example: Show the resulting salaries if every employee working on the 'ProductX' project is given a 10 percent raise.

```
SELECT E.Fname, E.Lname, 1.1 * E.Salary AS Increased_sal FROM EMPLOYEE AS E, WORKS_ON AS W, PROJECT AS P WHERE E.Ssn=W.Essn AND W.Pno=P.Pnumber AND P.Pname='ProductX';
```

• Also **standard statistical operations** (such as max, min, count, sum, mean, etc.)

Ordering of Query Results

- Use ORDER BY clause
 - Keyword DESC to see result in a descending order of values
 - Keyword ASC to specify ascending order explicitly
 - Typically placed at the end of the query

ORDER BY D.Dname DESC, E.Lname ASC, E.Fname ASC

Break 10 min

Basic SQL Retrieval Query Block

```
SELECT <attribute list>
FROM 
[ WHERE <condition> ]
[ ORDER BY <attribute list> ];
```

where, [] brackets mean not mandatory/optional Every block is finished by semicolon ';'

INSERT Command

- INSERT typically inserts a tuple (row) in a relation (table)
- Attribute values should be listed in the same order as the attributes were specified in the CREATE TABLE command
- Constraints on data types are observed automatically
- Any integrity constraints as a part of the DDL specification are enforced
- Specify the relation name and a list of values for the tuple. All values including nulls are supplied.
 - Example:

 U1: INSERT INTO EMPLOYEE

 ('Richard', 'K', 'Marini', '653298653', '1962-12-30', '98
 Oak Forest, Katy, TX', 'M', 37000, '653298653', 4);

DELETE

- Removes tuples from a relation
 - Includes a WHERE-clause to select the tuples to be deleted
 - Referential integrity should be enforced
 - Tuples are deleted from only *one table* at a time (unless CASCADE is specified on a referential integrity constraint)
 - A missing WHERE-clause specifies that all tuples in the relation are to be deleted; the table then becomes an empty table
 - The number of tuples deleted depends on the number of tuples in the relation that satisfy the WHERE-clause

Example DELETE Command

- Removes tuples from a relation
 - Includes a WHERE clause to select the tuples to be deleted. The number of tuples deleted will vary.

U4A: DELETE FROM EMPLOYEE

WHERE Lname='Brown';

U4B: DELETE FROM EMPLOYEE

WHERE Ssn='123456789';

U4C: DELETE FROM EMPLOYEE

WHERE Dno=5;

U4D: DELETE FROM EMPLOYEE;

UPDATE (1)

- Used to modify attribute values of one or more selected tuples
- A WHERE-clause selects the tuples to be modified
- An additional SET-clause specifies the attributes to be modified and their new values
- Each command modifies tuples in the same relation
- Referential integrity specified as part of DDL specification is enforced
- Example: Change the location and controlling department number of project number 10 to 'Bellaire' and 5, respectively

```
UPDATE PROJECT
SET PLOCATION = 'Bellaire', DNUM = 5
WHERE PNUMBER=10
```

UPDATE (2)

• Example: Give all employees in the 'Research' department a 10% raise in salary.

```
UPDATE EMPLOYEE

SET SALARY = SALARY *1.1

WHERE DNO IN (SELECT DNUMBER

FROM DEPARTMENT

WHERE DNAME='Research')
```

- In this request, the modified SALARY value depends on the original SALARY value in each tuple
 - The reference to the SALARY attribute on the right of = refers to the old SALARY value before modification
 - The reference to the SALARY attribute on the left of = refers to the new SALARY value after modification

More Complex SQL Retrieval Queries

- Additional features allow users to specify more complex retrievals from database:
 - nested queries,
 - joined tables and JOIN operations
 - aggregate functions, and grouping

Comparisons Involving NULL and Three-Valued Logic

- Meanings of NULL
 - Unknown value
 - Unavailable or withheld value
 - Not applicable attribute
- Each individual NULL value considered to be different from every other NULL value
- SQL uses a three-valued logic:
 - TRUE, FALSE, and UNKNOWN (like Maybe)
- NULL = NULL comparison is avoided

Comparisons Involving NULL and Three-Valued Logic (cont'd.)

Table 7.1	Logical	Connectives	in Three-	-Valued ¹	Logic
		COHHECHASS		A STREET	Hartest Marie 1994

(a)	AND	TRUE	FALSE	UNKNOWN
	TRUE	TRUE	FALSE	UNKNOWN
	FALSE	FALSE	FALSE	FALSE
	UNKNOWN	UNKNOWN	FALSE	UNKNOWN
(b)	OR	TRUE	FALSE	UNKNOWN
	TRUE	TRUE	TRUE	TRUE
	FALSE	TRUE	FALSE	UNKNOWN
	UNKNOWN	TRUE	UNKNOWN	UNKNOWN
(c)	NOT	1		
	TRUE	FALSE		
	FALSE	TRUE		
	UNKNOWN	UNKNOWN		

Comparisons Involving NULL and Three-Valued Logic

- SQL allows queries that check whether an attribute value is NULL
 - IS or IS NOT NULL

Example:

Query 18. Retrieve the names of all employees who do not have supervisors.

Q18: SELECT Fname, Lname
FROM EMPLOYEE
WHERE Super_ssn IS NULL;

Nested Queries using IN

Query: Make a list of all project numbers for projects that involved an employee whose last name is 'Smith' either as a worker or as a manager of the department that controls the project.

The <u>first nested query</u> selects the project numbers of projects that have an employee with last name 'Smith' involved as manager. The <u>second nested query</u> selects the porject numbers of projects that have an employee with last name 'Smith' involved as worker.

Q4A:	SELECT FROM		
	WHERE	Pnumber IN	
		(SELECT	Pnumber
		FROM	PROJECT, DEPARTMENT, EMPLOYEE
		WHERE	Dnum=Dnumber AND
			Mgr_ssn=Ssn AND Lname='Smith')
		OR	
		Pnumber IN	
		(SELECT	Pno
		FROM	WORKS_ON, EMPLOYEE
		WHERE	Essn=Ssn AND Lname='Smith');

Nested Queries using Comparison Operator

- Use other comparison operators to compare a single value v
 - = ANY (or = SOME) operator
 - Returns TRUE if the value v is equal to some value in the set V and is hence equivalent to IN
 - Other operators that can be combined with ANY (or SOME): >, >=, <, <=, and
 - ALL: value must exceed all values from nested query

```
SELECT Lname, Fname
FROM EMPLOYEE
WHERE Salary > ALL ( SELECT Salary
FROM EMPLOYEE
WHERE Dno=5 );
```

Nested Queries using **EXISTS**

Retrieve the names of employees who have no dependents:

```
Select e.fname,e.lname
from employee e
where not EXISTS (select * from dependent d where e.ssn=d.essn);
```

List the names of managers who have at least one dependent:

```
select fname,Iname
from employee e
where exists (select * from dependent as d where e.ssn=d.essn)
and exists (select * from department as d2 where e.ssn=d2.mgrssn);
```

SQL Joins

LEFT JOIN

Everything on the left + anything on the right that matches SELECT *
FROM TABLE_1
LEFT JOIN TABLE_2
ON TABLE_1.KEY = TABLE_2.KEY

ANTI LEFT JOIN

Everything on the left that is NOT on the right

SELECT *
FROM TABLE_1
LEFT JOIN TABLE_2
ON TABLE_1.KEY = TABLE_2.KEY
WHERE TABLE_2.KEY IS NULL

RIGHT JOIN

Everything on the right + anything on the left that matches

SELECT *
FROM TABLE_1
RIGHT JOIN TABLE_2
ON TABLE_1.KEY = TABLE_2.KEY

ANTI RIGHT JOIN

Everything on the right that is NOT on the left

SELECT *
FROM TABLE_1
RIGHT JOIN TABLE_2
ON TABLE_1.KEY = TABLE_2.KEY
WHERE TABLE_1.KEY IS NULL

OUTER JOIN

Everything on the right +
Everything on the left

SELECT *
FROM TABLE_1
OUTER JOIN TABLE_2
ON TABLE_1.KEY = TABLE_2.KEY

ANTI OUTER JOIN

Everything on the left and right that is unique to each side

SELECT *
FROM TABLE_1
OUTER JOIN TABLE_2
ON TABLE_1.KEY = TABLE_2.KEY
WHERE TABLE_1.KEY IS NULL
OR TABLE_2.KEY IS NULL

INNER JOIN

Only the things that match on the left AND the right

SELECT *
FROM TABLE_1
INNER JOIN TABLE_2
ON TABLE_1.KEY = TABLE_2.KEY

CROSS JOIN

All combination of rows from the right and the left (cartesean product)

SELECT *
FROM TABLE_1
CROSS JOIN TABLE_2

40(44)

Aggregate Functions in SQL

- Used to summarize information from multiple tuples into a single-tuple summary
- Built-in aggregate functions
 - COUNT, SUM, MAX, MIN, and AVG
- Following query returns a single row of computed values from EMPLOYEE table:

```
SELECT SUM (Salary), MAX (Salary), MIN (Salary), AVG(Salary)
FROM EMPLOYEE;
```

• The result can be presented with new names:

```
SELECT SUM (Salary) AS Total_Sal, MAX (Salary) AS Highest_Sal, MIN (Salary) AS Lowest_Sal, AVG (Salary) AS Average_Sal

FROM EMPLOYEE;
```

Aggregate Functions in SQL (cont'd.)

NULL values are discarded when aggregate functions are applied to a particular column

Query 20. Find the sum of the salaries of all employees of the 'Research' department, as well as the maximum salary, the minimum salary, and the average salary in this department.

Q20: SELECT SUM (Salary), MAX (Salary), MIN (Salary), AVG (Salary)

FROM (EMPLOYEE JOIN DEPARTMENT ON Dno=Dnumber)

WHERE Dname='Research';

Queries 21 and 22. Retrieve the total number of employees in the company (Q21) and the number of employees in the 'Research' department (Q22).

Q21: SELECT COUNT (*)

FROM EMPLOYEE;

Q22: SELECT COUNT (*)

FROM EMPLOYEE, DEPARTMENT

WHERE DNO=DNUMBER AND DNAME='Research';

GROUP BY clause

The grouping attribute must appear in the SELECT clause:

Example: SELECT Dno, **COUNT** (*), **AVG** (Salary)

FROM EMPLOYEE

GROUP BY Dno;

• If the grouping attribute has NULL as a possible value, then a separate group is created for the null value (e.g., null Dno in the above query)

• GROUP BY may be applied to the result of a JOIN:

Example: SELECT Pnumber, Pname, COUNT (*)

FROM PROJECT, WORKS_ON

WHERE Pnumber=Pno

GROUP BY Pnumber, Pname;

Summary of SQL Syntax

```
Table 7.2 Summary of SQL Syntax
```

```
CREATE TABLE  ( <column name> <column type> [ <attribute constraint> ]
                           { . <column name> <column type> [ <attribute constraint> ] }
                           [  \{ ,  \} ] )
DROP TABLE 
ALTER TABLE  ADD <column name> <column type>
SELECT [ DISTINCT ] <attribute list>
FROM ( { <alias> } | <ioined table> ) { , ( { <alias> } | <ioined table> ) }
[ WHERE <condition> ]
[GROUPBY <grouping attributes> [HAVING <group selection condition>]]
 ORDER BY <column name> [ <order> ] { , <column name> [ <order> ] } ]
<attribute list> ::= ( * | ( <column name> | <function> ( ( [ DISTINCT ] <column name> | * ) ) )
                   {, (<column name>| <function> (([DISTINCT] <column name>| *))}))
<grouping attributes> ::= <column name> { , <column name> }
<order> ::= ( ASC | DESC )
INSERT INTO  [ ( <column name> { , <column name> } ) ]
(VALUES (<constant value>, {<constant value>}) {, (<constant value>})}
 <select statement>)
```

Summary of SQL Syntax

```
Table 7.2 Summary of SQL Syntax
DELETE FROM 
[ WHERE <selection condition>]
UPDATE 
SET <column name> = <value expression> { , <column name> = <value expression> }
[ WHERE <selection condition> ]
CREATE [ UNIQUE] INDEX <index name>
ON  ( <column name> [ <order> ] { , <column name> [ <order> ] } )
[ CLUSTER ]
DROP INDEX <index name>
CREATE VIEW <view name> [ ( <column name> { , <column name> } ) ]
AS <select statement>
DROP VIEW <view name>
NOTE: The commands for creating and dropping indexes are not part of standard SQL.
```

More Examples from the Book

16. Retrieve the name of each employee who has a dependent with the ame first name and is the same sex as the employee.

> SELECT FROM

E.Fname, E.Lname

WHERE

EMPLOYEE AS E

E.Ssn IN

D.Essn

SELECT FROM

DEPENDENT AS D

WHERE

E.Fname = D.Dependent_name

AND E.Sex = D.Sex);

Query 6. Retrieve the names of employees who have no dependents. Fname, Lname SELECT Q6: **FMPLOYEE** FROM NOT EXISTS (SELECT WHERE DEPENDENT FROM Ssn = Essn); WHERE

18. Retrieve the names of all employees who do not have supervisors.

the names of managers who have at least one dependent.

Fname, Lname SELECT **EMPLOYEE** FROM EXISTS (SELECT MIHERE

FROM DEPENDENT WHERE Ssn = Essn)

AND

EXISTS (SELECT

DEPARTMENT FROM WHERE $Ssn = Mgr_ssn);$ SELECT Fname, Lname FROM

EMPLOYEE

WHERE Super_ssn IS NULL:

Query 17. Retrieve the Social Security numbers of all employees who work project numbers 1, 2, or 3.

Q17:

SELECT FROM

DISTINCT Essn WORKS ON

WHERE

Pno IN (1, 2, 3);

Query 19. Find the sum of the salaries of all employees, the maximum salary, the minimum salary, and the average salary.

019:

SELECT

SUM (Salary), MAX (Salary), MIN (Salary), AVG (Salary)

EMPLOYEE: FROM

20. Find the sum of the salaries of all employees of the 'Research' departas well as the maximum salary, the minimum salary, and the average in this department.

SELECT

SUM (Salary), MAX (Salary), MIN (Salary), AVG (Salary)

FROM

(EMPLOYEE JOIN DEPARTMENT ON Dno = Dnumber)

WHERE

Dname = 'Research';

21 and 22. Retrieve the total number of employees in the company and the number of employees in the 'Research' department (Q22).

SELECT

COUNT (*)

FROM

EMPLOYEE:

SELECT

COUNT (*)

FROM

EMPLOYEE, DEPARTMENT

WHERE

DNO = DNUMBER AND DNAME = 'Research':

24. For each department, retrieve the department number, the number memployees in the department, and their average salary.

SELECT

Dno, COUNT (*), AVG (Salary)

FROM

EMPLOYEE

GROUP BY Dno:

Es. For each project, retrieve the project number, the project name, and member of employees who work on that project.

SELECT

Pnumber, Pname, COUNT (*)

FROM

PROJECT, WORKS ON

WHERE

Pnumber = Pno

GROUP BY Pnumber, Pname;

Query 26. For each project on which more than two employees work, retrieve the project number, the project name, and the number of employees who work on the project.

SELECT 026:

Pnumber, Pname, COUNT (*)

FROM

PROJECT, WORKS_ON

WHERE

Pnumber = Pno

GROUP BY

Pnumber, Pname

HAVING

COUNT (*) > 2;

27. For each project, retrieve the project number, the project name, and mber of employees from department 5 who work on the project.

SELECT

Pnumber, Pname, COUNT (*)

FROM

PROJECT, WORKS_ON, EMPLOYEE

WHERE

Pnumber = Pno AND Ssn = Essn AND Dno = 5

GROUP BY Pnumber, Pname;

Query 12. Retrieve all employees whose address is in Houston, Texas.

Q12:

SELECT

Fname, Lname

FROM

EMPLOYEE

WHERE

Address LIKE '%Houston,TX%';

Query 12A. Find all employees who were born during the 1950s.

Q12:

SELECT

Fname, Lname

FROM

EMPLOYEE

WHERE

Bdate **LIKE** '__7____';

Query 13. Show the resulting salaries if every employee working on the 'ProductX' project is given a 10% raise.

Q13:

SELECT

E.Fname, E.Lname, 1.1 * E.Salary AS Increased_sal

FROM WHERE EMPLOYEE AS E, WORKS_ON AS W, PROJECT AS P

E.Ssn = W.Essn AND W.Pno = P.Pnumber AND

P.Pname = 'ProductX';

Preparation for Exam

- Basic queries:
 - Selecting data from one table
 - Selecting data from several tables
 - Order By
 - Count(), SUM() operations
- Advanced queries:
 - Nested queries
 - Group By
